

```
编写Reduce处理逻辑
  •在Reduce处理数据之前,Map的结果首先通过Shuffle阶段进行整理
  •Reduce阶段的任务:对输入数字序列进行求和
  •Reduce的输入数据为<key,Iterable容器>
                   public static class MyReducer
                   extends Reducer<Text,IntWritable,Text,IntWritable>{
                     private IntWritable result = new IntWritable();
                     public void reduce(Text key, Iterable<IntWritable> values,
Reduce任务的输入数据:
                           Context context)
<"I",<1,1>>
<"is",1>
                        throws IOException, InterruptedException {
                                      int sum = 0
                                      for (IntWritable val : values)
<"from",1>
                                          sum += val.get(); }
<"China",<1,1,1>>
                                      result set(sum):
                                      context.write(key,result);
```
